SENIOR PRODUCT MANAGER · SELLER & OPERATIONS PLATFORMS

I find the problem underneath the request, then ship what fixes it.

5+ years building products for the people who run the business behind the storefront: merchants, operations teams and managers.

- **Seller platform.** At Upmesh, I built the seller dashboard that 1,000+ live-commerce merchants in Singapore, Malaysia and the Philippines use to run orders, inventory, promotions and buyer retention. I grew from PM to Head of Product, leading 5 PMs.
- **Operations and data.** At Mantu, I own the global sales-process platform used by about 500 managers and directors in 39 countries, including its management reporting and contract review.
- **Payments.** At MoMo, I owned cash-in and cash-out journeys for one of Vietnam's largest e-wallets.

Targeted data problems fixed in MARS	Countries on the sales platform I own	Merchants on the Upmesh seller platform	MoMo D-OTP cash-in success after a UX fix

CASE 01 · DATA & OPERATIONS PLATFORM

Half the "wrong numbers" were not report bugs

Mantu · MARS reporting
Product Owner · 2023 – now

WHAT I ACHIEVED

82%

- **88 of 107** targeted data problems fixed by the foundation I pushed for
- **31%** of all user feedback resolved in one release
- **96%** of MARS-side errors fixed across 408,865 automated checks

INSIGHT

I classified 217 manager complaints. 49% came from source data changed after the fact, not from MARS. 57% of people changes and 55% of project changes were backdated, but MARS froze each week.

WHAT I DID

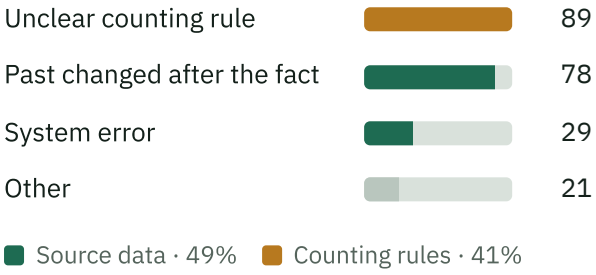

Reframed the roadmap from patching rules to rebuilding data history, so any past week can be recomputed. Set ownership across 9 source teams: they own the data, MARS owns the rules.

RESULT

Foundation v1 fixes 88 of 107 targeted problems, and 31% of all user feedback in one release. Automated checks across 635 managers show 96% of MARS-side errors fixed.

Where 217 complaints came from

Tickets and in-app "wrong number" flags, Jun – Sep 2026

Foundation v1

Problems that need a MARS-side fix, tested before release

82%

88	Fixed by the history foundation
14	Waiting on source teams
5	Still open on MARS side

CASE 02 · WORKFLOW & RISK PRODUCT

Contract review inside the sales flow, shaped with its users

Mantu · Opportunity Management
Product lead · discovery to MVP

WHAT I ACHIEVED

3 roles

- Ran discovery workshops with **senior business and legal users**, including directors, and got Sales and Legal to agree on **one review flow**
- Turned **30 pains** into **18 user stories** and a controlled MVP that everyone signed up to, with a measurable north star
- Tested a prototype built with AI in weeks; **2 design changes** came straight from usability sessions

Journey mapping → User story mapping → Rapid prototype → Usability testing

DISCOVERY

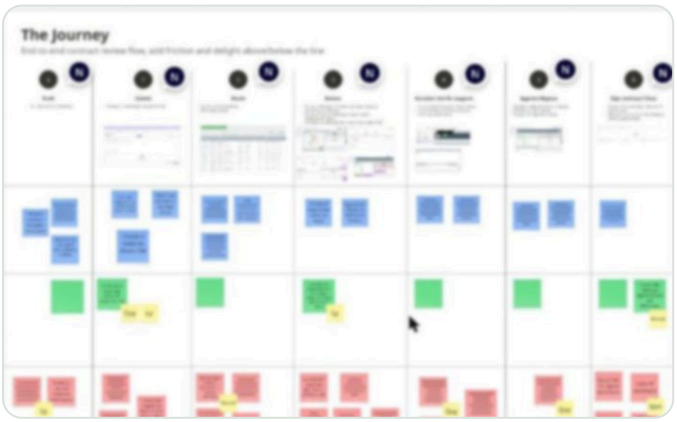

Users worked around the legal tool in email and chat, so its data could not show the real process. I chose to go to the people instead: I facilitated journey-mapping workshops with a representative of each persona, across 7 stages from draft to signed contract. They surfaced 30 pains against only 3 things that worked.

ALIGNMENT

Sales wanted speed, Legal wanted control, directors needed to know what they were approving. In a story-mapping workshop with the same senior users, I turned those needs into shared priorities: 18 stories, a controlled MVP, then optimise and scale. Agreed non-goals kept scope tight.

VALIDATION

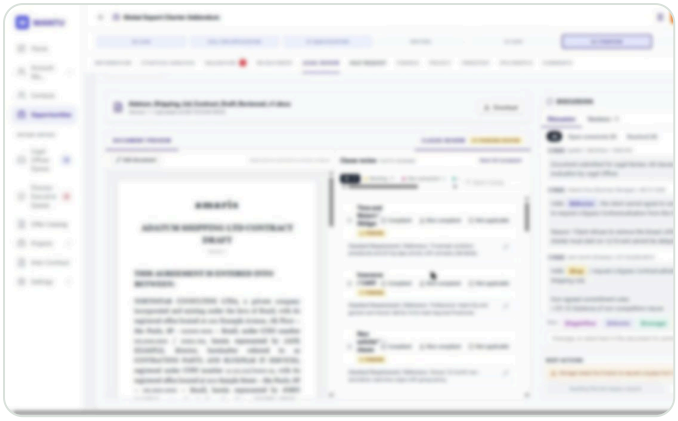

I built the prototype with AI tools: risk-based routing to Legal or Director, 26 commitment rules, controlled bypass. Testing with a manager and a sales director moved live editing out of the MVP and added a rules checklist for directors.

1 · Journey map from the user workshop (blurred).

2 · Deal pipeline as review queue (blurred).

3 · Legal officer clause review (blurred).

4 · Director rules checklist, added after testing (blurred).

CASE 03 · SELLER PLATFORM

The operations behind live selling, for 1,000+ merchants

Upmesh · SG, MY, PH

PM → Head of Product · 2021 – 2023

WHAT I ACHIEVED

6

- **6 seller modules** shipped across orders, inventory, promotions, loyalty and messaging, still live today
- Weighted-scorecard prioritisation adopted by engineering, design and business
- Promoted from PM to **Head of Product** in under 2 years, leading **5 PMs**

PROBLEM

Sellers ran orders, stock and payments by hand inside Facebook comments while the stream was live. Errors and lost carts grew with every sale.

WHAT I DID

Owned the merchant dashboard: order status and tagging, inventory variations, bundle deals, loyalty points, buyer credits, automated messages. Prioritised with a weighted scorecard; later led 5 PMs.

CASE 04 · PAYMENTS

A failed A/B test, read correctly, became a 72% success rate

MoMo · cash-in flow
Product Manager · 2023

WHAT I ACHIEVED

25→72%

- D-OTP cash-in success nearly **tripled** after one targeted UX fix
- Saved the D-OTP rollout for MB Bank cash-in instead of rolling it back

CONTEXT

I led the switch from SMS OTP to digital OTP (D-OTP) for cash-in from MB Bank to the MoMo wallet. The first A/B test showed only 25% of D-OTP attempts succeeding.

INSIGHT

The new flow worked technically. The gap was UX: the dialog for D-OTP looked almost the same as the old one telling users to open their SMS, so users waited for a text that never came.

RESULT

I shipped a clearer step that tells users to open the MB Bank app to get their OTP. Success rate rose from **25% to 72%**, and the D-OTP rollout went ahead.

AI BUILDER LAB

Ideas I test by building them

Personal products · 2026
Built with Claude Code

Quản Tiền · personal finance app

Turns Vietnamese bank statements into a monthly picture and a plan for big goals. Before building bank sync, I ran a fake-door test at 3 entry points to measure demand and willingness to pay.

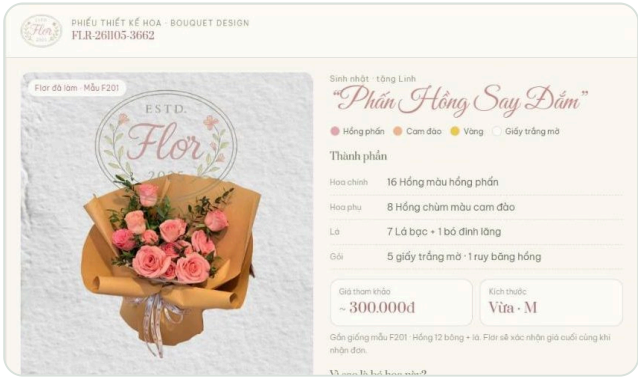

`React` `Supabase` `Claude API` `Fake-door test`

Flơr · bouquet designer

For my flower shop in Saigon. Customers describe who the flowers are for, and get a bouquet the shop can really make, priced with real market costs.
